"Renin and Angiotensinase Activity in Blood from the Renal Vein
After Administration of Angiotensin."

Prague, Casopis Lekarů Ceskych, Vol 106, No 9, 3 Mar 67, pp
232 - 236

Abstract [Authors' English summary modified]: Renin and angio-
tensinase activity in the blood from the renal vein of dogs was
investigated during the administration of angiotensin. Renin ac-
tivity decreased; when noradrenalin bitartrate was administered
simultaneously with the angiotensin, the renin activity increased.
Angiotensinase activity did not change under the experimental con-
ditions. 2 Figures, 2 Tables, 13 Western, 3 Czech references.

Moving coil (Depréz) relays METRA, type "RD"

of gold, alloyed with 10% nickel. Noble contact-metals had to be used, since the contact pressure of the "RD 10" is only 20 mg, that of the "RD 11" 150 mg. The entire relay is enclosed by an aluminum cover with the wiring printed on it (Photo 1 and Fig. 5). To avoid "sticking" of contacts, circuits with abrupt coil-current changes should be used. Windings of the "RD 10" are loaded by the coil current with 1.0 - 1.5 μ w, those of the "RD 11" with 0.1 μ w. The maximum permissible overload is 0.25 μ w. Contact currents and voltages are listed in Table 1. The maximum contact voltage is determined by the gap between the center and the fixed contacts, which is 0.4 mm. The maximum contact-making interval at an internal impedance of 1,000 Ω is 0.5 sec for the "RD 10" and 0.3 sec for the "RD 11" relay. Contact breaking is effected immediately upon interruption of the coil current. The shock-protected relays operate in all positions and within a temperature range of -20 to +50°C. The test-insulation voltage is 50v. The newly developed "RD 13" moving-coil relay is meant to replace the "RD 11" relay and has a central contact of platinum and fixed contacts of platinum alloyed with 10% iridium. The relays described are expected to be widely used in the automation of industrial processes. There are 4 photos, 2 figures and 1 table.

Thermodynamical properties of liquid metal ...

S/137/62/C00/002/004/144
A006/A101

of entropy ($\Delta \bar{S}_{Tl}$, $\Delta \bar{S}_{Ag}$) and enthalpy ($\Delta \bar{H}_{Tl}$, $\Delta \bar{H}_{Ag}$) of Tl and Ag, activities and activity factors of components, changes in the thermodynamical potential, entropy (ΔS) and enthalpy (ΔH) of mixing liquid Tl and supercooled liquid Ag. Isotherms of activity of the components in the liquid range of the Ag-Tl system show positive deviations from the Raoult's law only within a N_{Tl} range from about 0.1 to 0.4. The isotherm of Ag activity is characterized by a low negative deviation from this law. Mixing enthalpies are positive over the whole concentration range and show maximum values on the side of liquid solutions enriched with Tl. These maxima attain 950 cal. g-atom of the solution. $\Delta \bar{H}_{Tl}$, $\Delta \bar{H}_{Ag}$ and ΔH curves have an asymmetrical shape, and a maximum on the ΔH curve appears on the side which is opposite to the enormous majority of other liquid metal systems with sharply different atomic volumes of components. Values $\Delta \bar{S}_{Tl}$, $\Delta \bar{S}_{Ag}$ and ΔS for the liquid Ag-Tl system are higher than for ideal and regular solutions. The basic cause of this fact is the great difference between atomic volumes of Ag and Tl. Liquid Ag-Tl solutions behave like semiregular solutions with coefficient $D = 1.42$. Information VI see RZhMet, 1961, 3A14. ✓

TITLE: Thermodynamic properties of liquid Mg-Ga, Mg-In, and Mg-Tl
 alloys. Abstract of dissertation fi 27 27 27 27

SOURCE: Wiadomosci chemiczne, no. 2, 1966, 126-128

TOPIC TAGS: thermodynamic property, thermodynamic analysis, alloy,
 magnesium, gallium, indium, thallium, emf, temperature dependence, liquid
 metal

ABSTRACT: A method of measuring the emf of electrolytes is proposed.
 The measurements were carried out in the 673—920K temperature range;
 the emf values were calculated from the linear dependence of emf on
 temperature. 1) The liquid alloys: Mg-Zn, Mg-Cd, Mg-Ga, Mg-In,
 Mg-Sb, Mg-Al, although differing in their thermodynamic characteristics
 are shown to belong to the same group: $\Delta G_{ex} < 0$, $\Delta S_{ex} < 0$, $\Delta H < 0$.
 2) The liquid alloys: Mg-Tl, Mg-Sn, Mg-Pb, Mg-Bi are characterized by
 negative values for ΔG_{ex} and ΔH over the entire range of concentration,

Card 1/3

L 20430-66

ACC NR: AP6008104

while the values ΔS_{ex} in the system are mostly positive on the side of the eutectic poorest in magnesium which has the lowest melting point. 3) The liquid alloys: Mg-Si and Mg-Ni belong to the group $\Delta G_{ex} < 0$, $\Delta S_{ex} < 0$, $\Delta H < 0$. 4) The minimums on curves ΔG_{ex} , ΔS_{ex} and ΔH appear on the side of intermediate phases of variable content or compound showing congruent melting of temperatures higher than the other compounds. 5) Deviations from the behavior of ideal liquid solutions in the following series

Mg-Al & Mg-Si
Mg-Zn & Mg-Ga
Mg-Cd, Mg-In, Mg-Sn & Mg-Sb
Mg-Tl, Mg-Pb & Mg-Bi

increase of the periodical number in the compound closest to the noble metal in the given periodic group. 6) Deviations from the behavior of an ideal liquid solution in the following columns

Mg-Zn	Mg-Ga	Mg-Sn	Mg-Sb
Mg-Cd	Mg-In	Mg-Pb	Mg-Bi
	Mg-Tl

Med
1968. Morphogenesis and morphological interpretation of processes basitrabeculares and intrapolares of primordial skull of birds. O. Slaby Czech. Morfol., 1968, 4, 276-293 (Dept. of Histol. and Embryol., Faculty of Med., Pilsen Univ., Pilsen, Czechoslovakia). In the species *Fulica atra*, *Larus ridibundus*, *Corvus frugilegus*, and *Sturnus vulgaris*, the processus basitrabeculares develop from mesenchyme probably of visceral origin as an independent cartilaginous structure which does not chondrify in connection with the pedal cartilages, but joins with them only secondarily. The processes show great variability in their structure and their development differs in various species depending on the extent of growth of the most dorsal parts of the oral cavity. The processus intrapolaris is a processus basitrabeculares which unites in its rostral parts with the quadratum, and in its caudal parts with the parachordalia. (Czech. English summary) A. ACKROYD

INST. : On Reduction of the First Metotic Segments
TITLE : During Early Stages of Development of Birds.

ORIG. PUB. : Ceskosl. morfol., 1957, 5, No 2, 185-200

ABSTRACT : Study of reduction of metotic segments in the embryonal development of Lake Gull (*Larus ridibundus*) and rook (*Corvus frugilegus*). In both species the first metotic segment is formed, from the very start, in reduced form; its cells show a tendency to undergo formation into epithelium and form a frequently poorly manifested somite, which unites, at the 14-somite stage, with the first true metotic somite. The second metotic somite is also smaller, from the very start, than the somites which are caudally disposed in relation thereto. Then, it becomes reduced still further, especially in rook embryos. The author is of the opinion that the cephalization process in the

TITLE: Attempt at immunoprevention of staphylococcal pyoderma 6

SOURCE: Vojenske zdravotnické listy, no. 6, 1965, 264-268 34

TOPIC TAGS: immunization, preventive medicine, military medicine, antitoxin, skin disease

ABSTRACT: Mass immunoprevention by the use of a staphylococcal antitoxin "Alstafan" was attempted. The best dose was 0.2 ml of the solution. In a military unit 221 soldiers were immunized, and 202 not, serving as controls. No clear cut results were obtained. This was due mainly to the fact that very few pyoderma occurred in the unit during the experiment. The authors thank Doctor J. Stepankova of the Institute for Sera and Vaccines for carrying out titrations. Orig. art. has: 4 figures and 1 table. [JPRS]

Title : ~~Instrument for Calibrating Gas Analysers.~~

Orig Pub: Chem. prumysl, 1956, 6, No. 9, 384 - 385.

Abstract: The instrument allows to prepare mixtures of vapors of organic substances liquid under normal conditions in preset ratios. The organic liquid is added drop by drop at equal time intervals to the flow of heated air that is sucked through at a constant volumetric speed, and this liquid evaporates immediately. The liquid is measured out by a special electromagnetic relay. Sometimes the concentration value of the organic substance

The formation of methane by fermentation A. Glaz and V. Shidreck. *Hornický Vestník* 21, No. 40, 61-2 (1955); *Chem. Zvesti* 1955, 11, 3324.—An app. is described in which sewage and sludge can be fermented to give a gas contg. 71-83% CH₄, 7-20% CO₂, and 1-9% N₂. The gas is free from H₂S and the unpleasant odor of the sewage disappears. It is important that the temp. of fermentation be maintained at 30-35°. W. A. Moore

SLÁDEČEK - VLADIMÍR

MD V Purification of waste waters by activated sludge as a biological process. Vladimír Sládeček. *Chem. Průmysl* 5, 415-19(1955).—The functioning of an exptl. station (Kasener system) has been studied for two years. The station has been in operation for the past 12 years. The following findings are given: The expected influence of temp. on biol. conditions was not uniform. Some microorganisms such as *Chilodonella* or *Vorticella* were equally abundant in summer as in winter; the majority, however, are stenothermal. In winter an abundance of Infusoria was noticed; in warm seasons *Sylonychia*, *Oxytricha*, etc., had their max. A relationship between the quantity of sludge and quantity of organisms is apparent. The influence of dissolved O_2 was noticeable only in different biol. communities in the mech. and the biol. part of the station. The relationship between pH of the water and nitrification, the influence of the quantity and velocity of sedimentation of the sludge on detn. of O_2 by the Winkler method, the relationship between the amt. of organisms in the sludge and purifying effect are discussed. The most const. purifying effect (80-90%) was found in the temp. range 7-13°. The av. purifying effect (out of 80 samples) was 82.4%, the lowest being 66% (in August), the highest 92% (in May). L. A. Helmick
